

Titanium Ingot, Mill Products, and Castings

JUNE 1979

ITA-991 (79)-6 formerly DIB-991 Issued August 1979

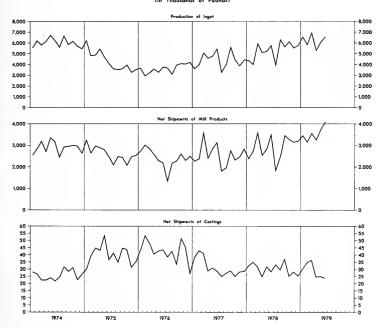

U.S. Department of Commerce
BUREAU OF THE CENSUS
BUREAU OF DOMESTIC BUSINESS DEVELOPMENT

The statistics in this publication are based on a survey of manufactures and represent total U.S. shipments of titanium ingot, mill products, and castings. Estimates are included for

companies whose reports were not received in time for tabulation. A more complete description of this survey appears on page 4.

THIS REPORT INCLUDES DATA COMPARING DOMESTIC OUTPUT, EXPORTS, AND IMPORTS

TITANIUM INGOT AND MILL PRODUCTS: 1974 TO 1979
(In Thousands of Pounds)

Address inquiries concerning these figures to the U.S. Department of Commerce, Industry and Trade Administration, Bureau of Domestic Business Development, Materials Division, Washington, D.C. 20230, or to the Bureau of the Census, Industry Division, Washington, D.C. 20233, or call Stephen M. Pope, (3011 763-2529.

For sale by the Subscriber Services Section (Publications), Bureau of the Census, Washington, D.C. 20233, or any U.S. Department of Commerce district office. Postage stamps not acceptable, currency submitted at sender's risk. Remittances from foreign countries must be by international money order or by a draft on a U.S. bank. Price 25 cents per copy, \$3.25 per vear.

Table 4. COMPARISON OF STANDARD INDUSTRIAL CLASSIFICATION (SIC) CODES, EXPORT (SCHEDULE B) CODES, AND IMPORT (TSUSA) CODES

1979 SIC product code	SIC Code Description	1979 Export code (Schedule B)	Export Code Description	1979 Import code (TSUSA)	Import Code Description
33562 74 33562 79	Forging and extrusion billet Other (sheet, plate, tubing, bar, etc.)	630,6570	Wrought titanium metal, including alloys (excludes sponge, ingots, billets, blooms, sheet bars, slabs, waste and scrap)	629.2000	Wrought titanium metal, including alloys (excludes waste and scrap and unwrought metal)

¹See table 4 for comparison of Standard Industrial Classification (SIC) codes, Export (Schedule B) codes, and Import (TSUSA) codes.

²Source: Bureau of the Census Report FT-410, U.S. Exports, Commodity by Country.

These values were derived by use of adjustment factors to exclude freight immurance, and other charges incurred in moving goods to the port of export. This adjustment is made to convert the values to an approximation of the producers' value of experted goods. Current adjustment factors are based on data for 1976 which are published in "Origin of Exports of Manufacturing Establishments" MF6(AS)-8, appendix A. Comparable adjustment factors for earlier years are based on similar factors developed for 1971 and 1972. The adjustment factor for this report is .953.

Source: Bureau of the Census Report IM 146-X, U.S. Imports for Consumption and General Imports.

Beginning with 1978, the dollar value represents the c.1.f. (cost, insurance, and freight) value at the first port of entry in the United States

plus U.S. import duties.

Apparent consumption is derived by subtracting exports from the total of net shipments plus imports.

DESCRIPTION OF SURVEY

Scope of Survey—This survey covers firms engaged in manufacturing titanium ingot and mill products, including castings.

Sampling Description—The statistics in this publication were collected on the Bureau of Domestic Business Development Form ITA-991, Titanium Metal. The mailing panel for this survey includes all known titanium ingot, mill product, and castings producers.

Survey Error—Figures for the current month include estimates for respondents whose reports were not received in time for tabulation. Such missing figures are "imputed" from month-to-month movements shown by reporting firms and are generally limited to a maximum of 10 percent for any one item. Individual items with imputation rates greater than 10 percent are footnoted.

The imputation rate is not an explicit indicator of the potential error in published figures due to nonresponse, because the actual monthly movements for nonrespondents may or may not closely agree with the imputed movements. The probable range of difference between the actual and imputed figures is unknown. The degree of uncertainty regarding the accuracy of the data, however, increases as the percentage of imputation increases. Figures with imputation rates above 10 percent should be used with caution.

Revision to Previous Period Data—Statistics for previous months may be revised due to receipt of corrected data from respondents, including late reports for which imputations were previously made as described above, and other corrections. Figures which have been revised by more than 5 percent from previously published figures are indicated by footnotes.

Seasonal Adjustment—The data are not adjusted for seasonal variation or number of working days.

EXPLANATION OF TERMS

Net Shipments—Derived by subtracting the sum of producers' receipts of each mill shape from the industry's gross shipments of that shape.

Gross Shipments—Include the quantities of mill shapes consumed in rolling mills in the production of fabricated products such as forgings, etc. Also includes the quantities of mill shapes shipped between producers.

COMPARISON OF EXPORT, IMPORT, AND DOMESTIC OUTPUT DATA

The Standard Industrial Classification (SIC) system used for domestic output and the statistical export and import commodity classifications were developed independently and are based on somewhat differing systems of classification. This results in considerable difficulty in comparing the three types of data for many commodity areas. The domestic output classifi-

cation is based on type of industry; whereas, the export and import classification system is more materials oriented. Aside from the differences in the basic commodity classifications, there are additional problems involving import data, since there are a substantial number of imported commodities which are not produced in the United States or which are produced only in very small quantities and which, therefore, have no comparable domestic output classification. The relationships shown in this report should be considered only as approximations, since, in addition to those mentioned above, there are also the following problems affecting the comparability of the three sets of data:

a. Valuation—There are different methods of valuation for the three types of data.

Domestic Output—Valued at the point of production. It includes the net sales price, f.o.b. plant, after discounts and allowances, exclusive of freight charges and excise taxes.

Exports—Valued at the point of exportation. It includes the selling price, or cost if not sold, and inland freight, insurance, and other charges to the export point.

Estimated producers' value of exports have also been developed. These values more closely approximate the values reported for domestic output because they exclude freight, insurance and other charges applied from the producing plant to the export point.

Imports—Valued at the first port of entry in the United States. It includes c.i.f. (cost, insurance, and freight), duty, and other charges to the import point.

- b. Duplication in Quantity and Value of Qutput—Because producers' shipments of some commodities may be used as materials for incorporation into other commodities, combinations of data for such commodities may contain a certain amount of duplication. Thus, percentages of exports to output or imports to apparent consumption (output plus imports minus exports) at four-digit or broader levels may be understated. Where duplication is known to be substantial, the output data are appropriately noted in the table.
- c. Low-Valued Export and Import Transactions—Commodity information is not shown for individual imports valued under \$251. For exports, commodity information is not reported for shipments individually valued under \$251 effective October 1969 and for shipments valued under \$100 prior to October 1969. This is believed to have only negligible effect on the statistics for most commodities.
- d. Manufacturers' Shipments, Not Specified by Kind—The value of manufacturers' shipments at the four-digit industry level often includes a small amount which is not distributed among the individual five-digit product classes. Export and import percentages at the more detailed levels might, therefore, be slightly overstated.
- e. Time Lag Between Output and Exports—There will be a lag between the time a commodity is produced or shipped by the producer and the time it is actually exported, especially

when intermediaries (wholesalers, exporters, etc.) are involved. Ordinarily, this type of discrepancy is insignificant in annual figures.

- f. "Direct" vs "Total" Commodity Export and Imports— Export and import data do not include materials which are incorporated into other more finished products and exported or imported in finished form. Thus, by showing only direct exports and imports, the relation of exports to output and imports to apparent consumption for intermediate products is considerably understated.
- g. Used Commodities—With a few exceptions, used or rebuilt commodities are classified in the same import or export codes as is new merchandise. Percentages are thus overstated to the extent that used or rebuilt products are significant in trade.

RELATED REPORTS

market absorption of apartments

At what rate are newly constructed apartments rented or otherwise absorbed? Find the answers in these quarterly housing reports—

"MARKET ABSORPTION OF APARTMENTS" — Series H-130

Because of the continuing interest in apartment construction throughout the Nation, both private industry and Government have a need for information on the nature of the demand for rental housing. This report is designed to provide data concerning the rate at which non-subsidized and unfurnished privately financed units in buildings with 5 or more units are rented (or absorbed). The "Market Absorption of Apartments" quarterly report provides data on the time it takes to rent new apartment units by showing percents absorbed at 3, 6, 9, and 12-month intervals following completion of the units. Three-month absorption rates are also presented for some characteristics of the units, such as asking rent classes and number of bedrooms. Beginning with the First Quarter 1976 report, data for cooperative and condominium apartment units, such as the total completed and the 3-month absorption rate, are also provided.

The annual report provides similar data for the geographic areas of regions of the U.S. and for inside and outside SMSA's of the U.S. In addition, data are presented on facilities and services offered in new rental units, such as air conditioning and swimming pools.

"CHARACTERISTICS OF APARTMENTS COMPLETED" — Series H-131

This report provides data on the characteristics of non-subsidized and privately financed apartment units in buildings with 5 or more units completed during a calendar year. For unfurnished units, the characteristics include number of bedrooms, asking rent classes, and the three-month absorption rate. Geographically, the data are presented by regions of the U.S. and by inside and outside SMSA's for the U.S.

For furnished units, data are presented for the U.S. by asking rent classes and number of bedrooms. For cooperative and condominium units, data are given for the U.S. by number of bedrooms, regions, and percent absorbed after 3 months.

These publications are of great value to builders, bankers, market analysts, land planners, and Government officials trying to measure the needs for Federal, State, and local assistance in providing better housing for everyone.

The statistics of these reports are based on a survey conducted by the Bureau of the Census, U.S. Department of Commerce, for the Department of Housing and Urban Development.
